Reason for Allowance

1. Applicant's arguments filed 6/23/08 (on pages 8-11 of the response) with respect to independent claims 1,15 and its dependent claims have been fully considered and are persuasive. The rejection of the claims has been withdrawn from the previous office action mailed 3/21/08 and the **claims 1-9,11,12,14-20 are allowed.**

Allowable Subject Matter

2. The following is a statement of reasons for the indication of allowable subject matter:

The present invention is directed towards a method that is performed with, a communication system comprised of a plurality of different base transceiver stations. The invention includes base transceivers stations or 'BTSs' being capable of providing data communications services to mobile devices operating within the coverage area of each BTS. Further, a "relay device" couples the base transceiver stations to the apparatus that effectuates synchronization of the network copy of a database to a mobile node copy of a database and that the claimed apparatus is located at the network part and therefore not at a base station transceiver. More importantly, the base stations, network part and the mobile nodes are part of the same "communication system". The invention further comprises:

- a mapper embodied at the network part, said mapper selectably operable to form a map between fields of a data record of a network-copy database, the network-copy database having a network-copy schema and, fields of a corresponding data record of the mobile-copy database, the mobile-copy database having a mobile schema, the mobile-copy database schema being different than the network-copy database schema, the map

indexing together the fields of the data record of the network-database with the fields of the corresponding data record of the mobile-copy database, said mapper forming the map upon detection of change to the data record of the network-copy database;

- a synchronization request generator that receives the map, generates a synchronization request from the map, and which provides the synchronization request to a synchronization server, the synchronization server including a filter that filters out of a synchronization request to a mobile node, a request to update data for a field of a data record in the mobile-copy database for which a corresponding field of a corresponding data record does not also exist in the network-copy database;
- wherein the synchronization server generates a synchronization request to be sent to a mobile node through a BTS in whose coverage area in which the mobile node is operating, the synchronization request including data for a record in the network-copy database that is to be copied into a record to be updated in the mobile node, the mobile node record to be updated being identified within the synchronization request by an integer generated from the map and identifying to both the mobile node and to the network part, the mobile node record to be updated, and wherein the mobile-copy database and the network-copy database are capable of being synchronized uninterruptedly as the mobile node travels through successive ones of communication coverage area cells.

The prior art reference Chase discloses a method wherein a mobile or handheld computer being wirelessly connected to a host computer via a wireless carrier and a method of automatic synchronization between a handheld device and a host computer.

Prior art reference Yianilos relates to the design and implementation of a database system that includes among its basic functions the ability to efficiently synchronize all or part of the data within a specified key range.

Ramanujam, in the same field of endeavor, discloses a method wherein the synchronization request includes within it a record to be updated in the mobile node, the record to be updated being identified within the synchronization request by an integer generated from the map and identifying to both the mobile node and to the network part, the mobile node record to be updated.

The prior art references, however, individually or in combination fails to render the above underlined unique feature obvious. Therefore the independent claims 1,15 and its dependent claims are allowed.
